

AfricaHackon Domain Reconnaissance Report

Objective

Identify subdomains, determine live hosts, identify technologies and detect firewall protection.

Tools Used

Subfinder, httpx, httpx Technology Detection, wafw00f and Linux command pipelines.

Methodology

1. Enumerate subdomains.
2. Verify live hosts.
3. Detect technologies.
4. Detect WAF.
5. Analyse results.

Key Findings

43 subdomains discovered.

Multiple live services identified.

Cloudflare WAF protecting several critical services.

Technologies detected included LiteSpeed, Cloudflare, React, Next.js, PHP, WordPress, MySQL and Vercel.

Figure 1. Subdomain Enumeration using Subfinder

Subfinder was used as the initial reconnaissance tool to discover publicly accessible subdomains belonging to africahackon.com. The scan identified 43 unique subdomains, including academy, summit, events, dojo, LMS, webmail, cPanel and others. These results formed the basis for all subsequent verification and security analysis.

```
michaelmunavu@Michaels-MacBook-Pro ~ % subfinder --all -d africahackon.com

Figure 2. Live Host Verification using httpx

The discovered subdomains were piped into httpx to verify which hosts were online. Besides confirming live services, httpx returned HTTP status codes, page titles and technology fingerprints. The scan identified technologies such as Cloudflare, LiteSpeed, React, Next.js, WordPress, PHP, MySQL and Vercel, providing insight into the web infrastructure.

```

Figure 3. Firewall Detection using wafw00f (Part I)

wafw00f was executed against the validated hosts to determine whether they were protected by a Web Application Firewall (WAF). Some services showed no detectable WAF, indicating they may be directly exposed, while others were identified as being protected by Cloudflare.

```
[michaelmunavu@Michaels-MacBook-Pro ~ % wafw00f -i live_hosts.txt

Figure 4. Firewall Detection using wafw00f (Part II)

The remaining hosts were analysed using wafw00f. Administrative services such as academy, cPanel, webmail and events were confirmed to be behind Cloudflare WAF. This demonstrates that critical systems have an additional security layer capable of filtering malicious web traffic.

Conclusion

The assessment successfully identified exposed subdomains, verified live services and confirmed Cloudflare WAF on several critical endpoints.
